Data Science: The Future

The role of data scientist is now a buzz worthy career. It has staying power in the marketplace and provides opportunities for people who study data science to make valuable contributions to their companies and societies at large.

Companies Struggle to Manage Their Data

Businesses have opportunities to collect data from customers regarding transactions, website interactions and more. But, according to the 2018 Data Security Confidence Index from Gemalto, 65 percent of the businesses polled said they couldn't analyze or categorize all the data they had stored. Plus, 89 percent knew that if they could analyze information properly, they'd have a competitive edge.

New Data Privacy Regulations Increase the Need for Data Scientists

In May 2018, the General Data Protection Regulation (GDPR) took effect for countries in the European Union. In 2020, California will enact a similar regulation for data privacy. The GDPR increased the reliance companies have on data scientists due to the need for real-time analytics and storing data responsibly.

Companies can no longer afford to treat their data irresponsibly. And, the GDPR and California's data privacy rules are likely only the beginning. Data scientists can help businesses use data in a beneficial way that aligns with those privacy stipulations.

Data Science Is Still Evolving

Careers without growth potential stay stagnant, usually indicating that jobs within those respective fields must drastically change to remain relevant. Data science appears to have abundant opportunities to evolve over the next decade or so. Since it shows no signs of slowing down, that's good news for people wanting to enter the field.

One minor change likely to emerge soon is that data science job titles will get more specific. A person working as a data scientist at one company is not necessarily doing the same thing as an individual in that same role at another enterprise.

Data Scientists Have In-Demand Skills

Research shows 94 percent of data science graduates have gotten jobs in the field since 2011. One of the indicators that data science careers are well-suited for the future is the dramatic increase in data science job posts. Statistics from Indeed.com show a steady increase in the number of data science jobs listed over the years.

More specifically, there has been a 256 percent increase in them since 2013, which suggests companies recognize the worth of data scientists and want to add them to their teams.

A Staggering Amount of Data Growth

People generate data daily, but most probably don't even think about it. According to a study about current and future data growth, 5 billion consumers interact with data daily, and that number will increase to 6 billion by 2025, representing three-quarters of the world's population.

High Likelihood of Career Advancement Opportunities

Employees must show initiative to seize the chances to excel in data science roles, of course, but LinkedIn's conclusions suggest companies intend to keep data scientists on their teams for the long run. If businesses didn't view data scientists as applicable to their future competitiveness and prosperity, they likely wouldn't offer promotions.

IOT: Every Where

The rapid expansion of IOT applications is stimulating substantial evolutions of networks in order to support the requirements of hyper-connectivity across all IOT environments.

Today, IoT wireless connectivity could be addressed by integrating IOT capabilities onto existing mobile terrestrial infrastructures like Sigfox or Lora (Terrestrial IOT) but not onto space communication systems (Space IOT); the latter is still in its early stages today and any progress into this blue ocean will bridge existing IOT gaps.

IOTEE provides a unique approach in the world to providing IOT LPWA services from space, enabling a doubling of Europe's Space IOT market share from 5% today to 10% by 2020, representing a multi Bn market opportunity.

Accelerating adoption of IOT allows earlier access to the economic and societal benefits from cheaper, more autonomous operation of very large networks of small devices. IOTEE bridges a gap in the provision of IOT communications, particularly true over very long distances and in complement to densely populated smart cities.
